

BE -SAFE

Tracking covid-19 infected persons and identifying the persons who are in contact with them is a cumbersome job. In present scenario there is no tool to help government officials to track the infected persons. Our project would be helpful for the government to track potentially infected places.

Our project is to develop a website for the safe travel of people in the light of corona and easy tracking of potentially infected places. It helps us to distance ourselves from potentially prone areas.

The site consists of

1. Options to choose the current state of people in particular area without revealing their identity
2. Number of people affected and in quarantine in each district.
3. Provision of government for retrieving information of people who visited particular region.

Amidst the fast spreading epidemic, our project helps to track potentially infected locations. The resource is made available to the common people but confidentiality is maintained as the details of potentially infected persons is exclusively authoritative.

The project can be made practical by the coordination of all sections working for the prevention of corona virus. The hospitals and government should accurately upload information and citizens should strictly keep track of instructions given. The complete implementation of the project requires an active mobile network of citizens.
